

Implementation of Human Factors considerations in PCTA

1) Visual Feedback to patient:

Icons or symbols will display cardiac status conditions and implanted device status conditions. Each symbol will be a different shape, location and color, in order to achieve shape, location and color coding. All of this is achieved without words or abbreviations to read. This obviates the need to read or the ability to read. Each shape code (color location) is chosen to represent status. - see page 57

2) The "display" of the icon(s) is achieved through a dead front process. The icon is lighted by an LED. Light emitting diode from behind it. When the LED is off, the displayed icon is not visible.
